3	Multiuser MIMO			1
	3.1 Multiple Acce		e Access Channel (MAC)	2
		3.1.1	Detector structures	2
		3.1.2	Rate region	3
	3.2	Broad	ast Channel	10
		3.2.1	Multiplexing Gain - Degrees of freedom	10

3 Multiuser MIMO

- We distinguish two cases:
 - multipoint to point transmission
 - point to multipoint transmission
- Multipoint to point transmission
 - typical uplink scenario in cellular systems
 - information theoretical channel model: Multiple Access Channel (MAC)

- Point to -multipoint transmission
 - typical downlink scenarion in cellular systems
 - information theoretical channel model: Broadcast Channel (BC)

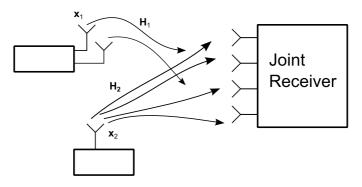

- $\bullet\,$ Advantage of multiuser MIMO compared to point-to-point MIMO
 - multiplexing gain can be exploited even if users have only single antenna
 - users are spatially distributed in cell \rightarrow channels to different users are independent

3.1 Multiple Access Channel (MAC)

We consider two aspects:

- Detector structures
- Rate region

3.1.1 Detector structures

Channel model: \rightarrow general MAC: $\mathbf{y} = \sum\limits_{k=1}^K \mathbf{H}_k \mathbf{x}_k + \mathbf{n}$

with:

- K users
- user k has $N_{T,k}$ transmit antennas
- N_R receive antennas
- $\mathbf{H}_k \in \mathbb{C}^{N_R \times N_{T,k}}$

$$\mathbf{y} = \underbrace{\begin{bmatrix} \mathbf{H}_1 & \mathbf{H}_2 & \dots & \mathbf{H}_k \end{bmatrix}}_{\mathbf{H}} \cdot \underbrace{\begin{bmatrix} \mathbf{x}_1 \\ \vdots \\ \mathbf{x}_k \end{bmatrix}}_{\mathbf{x}} + \mathbf{n}$$

Observation:

- same equivalent channel model as for a point-to-point MIMO system transmitting $N_T = \sum_{k=1}^K N_{T,k}$ independent signal streams (Anmerkung: kein Unterschied für Empfänger, ob Signale von einem Nutzer oder von mehreren)
- the receiver (e.g. base station) can use detection schemes as for point to point MIMO systems
 - linear receiver
 - DFG
 - sphere decoder

Typical problems in uplink multiuser MIMO For given receiver structure:

- calculate SNR_k for all users k based on the expressions developed in Chapter 2.4
- optimize transmit power of users, $E_k = \mathcal{E}\{||x_k||^2\}$ for maximization of the sumrate or maximization of the minimum SNR_k (Anmerkung: Maximierung der sumrate kann durch Maximierung des SNR des Users mit bestem Kanal erfolgen, aber: unfair anderen Usern gegenüber \Rightarrow starving)

3.1.2 Rate region

For point-to-point links, we can decode error free, if the rate, R, meets

a) SISO
$$R < \log_2 \left(1 + \frac{\mathcal{E}_s}{\sigma_n^2}\right)$$

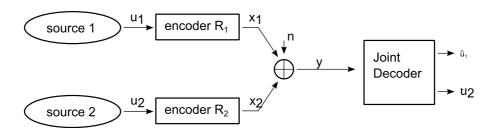

b) MIMO
$$R < \log_2 \underbrace{\left| \mathbf{I} + \frac{\mathcal{E}_s}{N_T \sigma_n^2} \mathbf{H} \mathbf{H}^H \right|}_{\text{left}}$$

Questions: What happens if there are multiple users?

Rate Region for Single Antenna Users and Receivers

- Gaussian channel
- $N_R = N_{T,k} = 1 \forall k$
- received signal:

$$y = \sum_{k=1}^{K} x_k + n$$
$$*\mathcal{E}_k = \mathcal{E}\{||x_k||^2\}$$
$$*\sigma_n^2 = \{||n||^2\}$$

Example: 2 Users

- How should we choose R_1 and R_2 to ensure error free decoding of <u>both</u> signal streams?
- It is no longer sufficient to maximize a single rate. Instead we have to consider rate pairs (R_1, R_2)
- All possible rate points, that allows error free decoding, define the rate region C

- Possible desing goals of the system:
 - maximized sum rate $R_{\text{sum}} = \max_{(R_1, R_2) \in \underline{C}} R_1 + R_2$
 - maximize minimum user rate: $R_{\text{max-min}} = \max_{(R_1, R_2) \in \underline{C}} \min_{i \in \{1, 2\}} R_i$
- Rate Region of two user Gaussian MAC Anmerkung: Einschränkungen

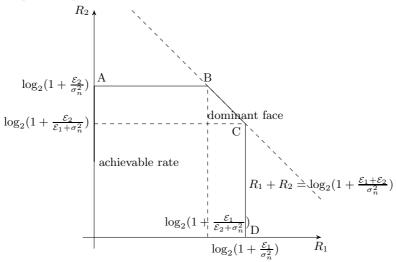

$$R_1 < \log_2\left(1 + \frac{\mathcal{E}_1}{\sigma_n^2}\right) \tag{1}$$

$$R_2 < \log_2\left(1 + \frac{\mathcal{E}_2}{\sigma_n^2}\right) \tag{2}$$

$$R_1 + R_2 < \log_2\left(1 + \frac{\mathcal{E}_1 + \mathcal{E}_2}{\sigma_n^2}\right) \tag{3}$$

• Interpretation:

- (1) and (2) (= single-to user constraint) are the "single-user bounds, i.e., the maximum rates of user 1 and 2, if the other user was not there
- (3) can be interpreted as the maximum rate if streams of users 1 and 2 were jointly encoded. The separate encoding in the MAC cannot yield a better performance
- Graphical representation:

• Observations:

- A-B is defined by (2)
- C-D is defined by (1)
- B-C is defined by (3)
- A B suggests that even if user 2 transmits with the same max. rate as in the single user case, user 1 can transmit with non-zero rate! \rightarrow Multiuser communication enables "free rate gains!
- Which point on A-B-C,-D we choose, depends on the design criterion

- How do we achieve points on A-B-C,-D?
 - Both user use Gaussian codebooks
 - B:
 - * signal of user 1, x_1 , is decoded first and x_2 is treated as noise:

$$y = x_1 + \underbrace{x_2 + n}_{\text{treat as noise}}$$

$$\rightarrow R_1 < \log_2 \left(1 + \frac{\mathcal{E}_1}{\mathcal{E}_2 + \sigma_n^2}\right)$$

* once x_1 is known, we form

$$y - x_1 = x_2 + n$$

$$\to R_2 < \log_2 \left(1 + \frac{\mathcal{E}_s}{\sigma_n^2}\right)$$

* this approach is referred to as successive interference cancellation (SIC) and is a direct result of the chain rule in information theory:

$$I(X_1, X_2, Y) = I(X_1, Y) + I(X_2; Y|X_1)$$

- C: same as B, but X_1 and X_2 change rules
- Points on A-B, C-D can be achieved by decreasing the rate of users 1 and 2 respectively (not desirable)
- Points on B-C (dominant face): Achievable by "time-sharing, i.e., $\theta \cdot 100\%$ of the time we decode user 1 first and $(1-\theta)100\%$ of the time we decode user 2 first, $0 \le \theta \le 1$

$$R_{1} < \theta \log_{2}\left(1 + \frac{\mathcal{E}_{1}}{\mathcal{E}_{2} + \sigma_{n}^{2}}\right) + \left(1 - \theta\right) \log_{2}\left(1 + \frac{\mathcal{E}_{1}}{\sigma_{n}^{2}}\right)$$

$$R_{2} < \theta \log_{2}\left(1 + \frac{\mathcal{E}_{2}}{\sigma_{n}^{2}}\right) + \left(1 - \theta\right) \log_{2}\left(1 + \frac{\mathcal{E}_{2}}{\mathcal{E}_{1} + \sigma_{n}^{2}}\right)$$

$$\rightarrow R_{1} + R_{2} < \theta\left(\log_{2}\left(1 + \frac{\mathcal{E}_{1}}{\mathcal{E}_{2} + \sigma_{n}^{2}}\right) + \log_{2}\left(1 + \frac{\mathcal{E}_{2}}{\sigma_{n}^{2}}\right)\right) +$$

$$+ \left(1 - \theta\right)\left(\log_{2}\left(1 + \frac{\mathcal{E}_{1}}{\sigma_{n}^{2}}\right) + \log_{2}\left(1 + \frac{\mathcal{E}_{2}}{\mathcal{E}_{1} + \sigma_{n}^{2}}\right)\right) =$$

$$= \theta \log_{2}\left(\frac{\mathcal{E}_{1} + \mathcal{E}_{2} + \sigma_{n}^{2}}{\mathcal{E}_{2} + \sigma_{n}^{2}} \cdot \frac{\mathcal{E}_{2} + \sigma_{n}^{2}}{\sigma_{n}^{2}}\right) \cdot \left(1 - \theta\right) \log_{2}\left(\frac{\mathcal{E}_{1} + \sigma_{n}^{2}}{\sigma_{n}^{2}} \cdot \frac{\mathcal{E}_{1} + \mathcal{E}_{2} + \sigma_{n}^{2}}{\mathcal{E}_{1} + \sigma_{n}^{2}}\right) =$$

$$= \log_{2}\left(1 + \frac{\mathcal{E}_{1} + \mathcal{E}_{2}}{\sigma_{n}^{2}}\right)$$

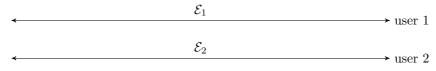

- Comparison with orthogonal transmission
 - User 1 transmits for $\theta \cdot 100\%$ of the time and user 2 transmits for $(1-\theta) \cdot 100\%$ of the time, $0 \le \theta \le 1$
 - to keep average transmit power independent of θ , the users transmit with powers $\frac{\mathcal{E}_1}{\theta}$ and $\frac{\mathcal{E}_2}{1-\theta}$

- Rates:

$$R_1 < \theta \log_2 \left(1 + \frac{\mathcal{E}_1}{\theta \sigma_n^2} \right)$$

$$R_2 < \left(1 - \theta \right) \log_2 \left(1 + \frac{\mathcal{E}_2}{(1 - \theta)\sigma_n^2} \right)$$

multiuser:

orthogonal:

- sumrate:

$$R_1 + R_2 < \theta \log_2 \left(1 + \frac{\mathcal{E}_1}{\theta \sigma_n^2}\right) + \left(1 - \theta\right) \log_2 \left(1 + \frac{\mathcal{E}_2}{(1 - \theta)\sigma_n^2}\right) = R_{\text{sum}}$$

– Which θ maximizes sumrate?

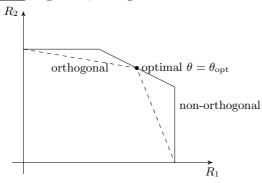

$$\frac{\delta R_{\text{sum}}}{\delta \theta} \stackrel{!}{=} 0 \text{ leads to } \theta_{\text{opt}} = \frac{\mathcal{E}_1}{\mathcal{E}_1 + \mathcal{E}_2}$$

- Maximum sumrate

$$\begin{split} R_{\text{sum}} &= \frac{\mathcal{E}_1}{\mathcal{E}_1 + \mathcal{E}_2} \log_2 \left(1 + \frac{\mathcal{E}_1 + \mathcal{E}_2}{\sigma_n^2} \right) + \frac{\mathcal{E}_2}{\mathcal{E}_1 + \mathcal{E}_2} \log_2 \left(1 + \frac{\mathcal{E}_1 + \mathcal{E}_2}{\sigma_n^2} \right) = \\ &= \log_2 \left(1 + \frac{\mathcal{E}_1 + \mathcal{E}_2}{\sigma_n^2} \right) \end{split}$$

 $\rightarrow\,$ same value as for general non-orthogonal transmission!

- <u>But:</u> In general, orthogonal transmission is suboptimal!

• 3 users case:

$$R_1 < \log_2\left(1 + \frac{\mathcal{E}_1}{\sigma_n^2}\right)$$

$$R_2 < \log_2\left(1 + \frac{\mathcal{E}_2}{\sigma_n^2}\right)$$

$$R_3 < \log_2\left(1 + \frac{\mathcal{E}_3}{\sigma_n^2}\right)$$

$$R_i + R_j < \log_2\left(1 + \frac{\mathcal{E}_i + \mathcal{E}_j}{\sigma_n^2}\right), \quad i \neq j$$

$$R_1 + R_2 + R_3 < \log_2\left(1 + \frac{\mathcal{E}_1 + \mathcal{E}_2 + \mathcal{E}_3}{\sigma_n^2}\right)$$

$$\rightarrow \text{rate region } \mathcal{C} \text{ has } 3! = 6 \text{ corner points}$$

- general case of K users
 - define all non-empty subsets of $\mathbf{K} = \{1, ..., K\}$ as $\mathbf{S} \in \mathbf{K}$, e.g. K = 2: $\mathbf{K} = \{1, 2\}, \mathbf{S} = \{\{1\}, \{2\}, \{1, 2\}\}$
- rate region C is defined by

$$\sum_{k \in \mathbf{S}} R_k < \log_2 \left(1 + \frac{\sum_{k \in \mathbf{S}} \mathcal{E}_k}{\sigma_n^2} \right) \quad \forall \, \mathbf{S}$$

 $\to \mathcal{C}$ has K! corner points which can all be achieved by successive interference cancellation (SIC)

Rate region for MIMO Users and Receivers

- Channel Model: $\mathbf{y} = \sum_{k=1}^{K} \mathbf{H}_k \mathbf{x}_k + \mathbf{n}$, with:
 - User k has ${\cal N}_{T,k}$ transmit antennas
 - $-N_R$ receive antennas
 - **n**: AWGN vector $\mathcal{N}(\mathbf{0}, \sigma_n^2 \mathbf{I})$

• 2 Users case:

$$\mathbf{y} = \mathbf{H}_1 \mathbf{x}_1 + \mathbf{H}_2 \mathbf{x}_2 + \mathbf{n} \tag{4}$$

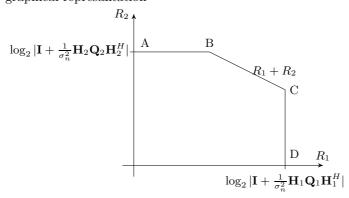

- Covariance matrix of the TX signal of user k: $\mathbf{Q}_k = \mathcal{E}\{\mathbf{x}_k \mathbf{x}_k^H\}$
- transmit power: $\mathcal{E}_k = \operatorname{tr}\{\mathbf{Q}_k\}$
- rate region for 2 user case and given \mathbf{Q}_k
 - \mathbf{Q}_k given, for example
 - a) \mathbf{Q}_k optimal for single user case $\rightarrow \mathbf{Q}_k = \mathbf{U}_k \mathbf{\Lambda}_k \mathbf{U}_k^H$, where:
 - · \mathbf{U}_k is an unitary matrix
 - · obtained from $\mathbf{H}_k = \mathbf{U}_k \mathbf{\Sigma}_k \mathbf{V}_{i}^H$
 - · $\Lambda_k = \text{diag}\{\mathcal{E}_{k,1}, \mathcal{E}_{k,2}, \dots, \mathcal{E}_{k,N_T}\}$ with $\mathcal{E}_{l,i}$ obtained from waterfilling and $\sum_{i=1}^{N_{Tk}} \mathcal{E}_{k,i} = \mathcal{E}_k$
 - b) $\mathbf{Q}_k = \frac{\mathcal{E}_k}{N_{T,k}} \mathbf{I}_{N_{T,k}}$ if \mathbf{H}_k is not known at transmitter
 - for given \mathbf{Q}_1 and \mathbf{Q}_2 we can obtain the rate region as direct extension of the SISO case

$$R_1 < \log_2 \left| \mathbf{I} + \frac{1}{\sigma_n^2} \mathbf{H}_1 \mathbf{Q}_1 \mathbf{H}_1^H \right| \tag{5}$$

$$R_2 < \log_2 \left| \mathbf{I} + \frac{1}{\sigma_n^2} \mathbf{H}_2 \mathbf{Q}_2 \mathbf{H}_2^H \right| \tag{6}$$

$$R_1 + R_2 < \log_2 \left| \mathbf{I} + \frac{1}{\sigma_n^2} \sum_{i=1}^2 \mathbf{H}_i \mathbf{Q}_i \mathbf{H}_i^H \right|$$
 (7)

- * equation 5 and equation 6 are the single user bounds,
- * equation 7 is the bound for the joint encoding of both users
- graphical representation

- Points on A-B-C-D can be achieved in a similar manner as for SISO case
- e.g. bound C can be achieved by SIC

- At B we have

$$R_{2} = \log_{2} \left| \mathbf{I} + \frac{1}{\sigma_{n}^{2}} \mathbf{H}_{2} \mathbf{Q}_{2} \mathbf{H}_{2}^{H} \right|$$

$$R_{1} = \log_{2} \left| \mathbf{I} + \frac{1}{\sigma_{n}^{2}} \sum_{i=1}^{2} \mathbf{H}_{i} \mathbf{Q}_{i} \mathbf{H}_{i}^{H} \right| - R_{2}$$

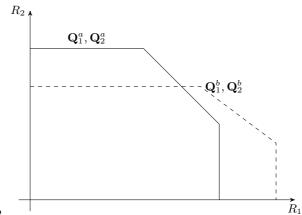

$$\rightarrow \text{ user 1 transmits with rate}$$

$$R_{1} = \log_{2} \left| \mathbf{I} + \frac{1}{\sigma_{n}^{2}} (\mathbf{I} + \frac{1}{\sigma_{n}^{2}} \mathbf{H}_{2} \mathbf{Q}_{2} \mathbf{H}_{2}^{H})^{-1} \mathbf{H}_{1} \mathbf{Q}_{1} \mathbf{H}_{1}^{H} \right|$$

- How to achieve rates at B? \rightarrow Treat $\mathbf{H}_2\mathbf{x}_2+\mathbf{n}$ in equation 4 as noise with covariance matrix $\mathbf{Q}_N = \mathbf{H}_2\mathbf{Q}_2\mathbf{H}_2^H + \sigma_n^2\mathbf{I}$
- \rightarrow equivalent channel matrix with white noise: $\mathbf{r} = \mathbf{Q}_N^{-\frac{1}{2}} \mathbf{y} = \mathbf{Q}_N^{-\frac{1}{2}} \mathbf{H}_1 \mathbf{x}_1 + \tilde{\mathbf{n}}$ where $\tilde{\mathbf{n}}$ is white noise with covariance \mathbf{I} .

Anmerkung: Rauschen war vorher farbig, muss "geweißt" werden.

- \rightarrow we can achieve R_1 in B by treating user 2 as noise
- \rightarrow once user 1 is detected, we can subtract its contribution from the received signal and detect user 2
 - \Rightarrow user 2 can transmit with maximum single user rate
- \rightarrow bound C can be achieved by SIC similar to SISO case
- points on B-C are achieved through time sharing
- ullet extension to K user case \to analogous to SISO case
- Note: Different choices for Q_k will lead to different rate regions

• Example: K = 2

ightarrow \mathbf{Q}_1 and \mathbf{Q}_2 can be optimized to achieve desired trade-off between performance of users 1 and 2

3.2 Broadcast Channel

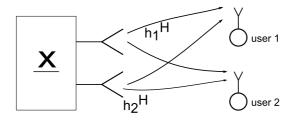

We consider:

- uplink downlink duality
- rate region

3.2.1 Multiplexing Gain - Degrees of freedom

Downlink scenarios:

- \bullet N_R antennas at transmitter, single antennas at the users
- user k receives: $\mathbf{y}_k = \mathbf{h}_k^H \mathbf{x} + \mathbf{n}_k$, with:
 - N_R dimensional channel vector of user k: \mathbf{h}_k^H
 - $-n_k$: AWGN at user k
 - **x** transmit vector

- How many independent signal streams can we transmit?
 - Consider transmit signal: $\mathbf{x} = \sum_{k=1}^{K} \mathbf{h}_k \mathbf{x}_k$, with TX transmit vector \mathbf{n}_k and symbol x_k is intended for user k
- received signal of user k: $y_k = \sum_{k=1}^K (\mathbf{h}_k^H \mathbf{n}_i) \mathbf{x}_i + n_k$
- if all \mathbf{h}_k were orthogonal and we chose $\mathbf{n}_k = \mathbf{h}_k$, the received signal would be: $y_k = ||h_k||^2 \mathbf{x}_k + n_k$
- if $N_R \ge K$, we can transmit simultaneously and interference free to all K users \Rightarrow multiplexing gain = min $\{K, N_k\}$
